

Made in Melbourne, the Heatmaster Enviro Gas Log Fire is designed for the largest of homes.

Its powerful high efficient burner is purpose built to not only give you low running costs, but to also give you great flames.

Like any engine, you can tune the fuel>air mix to get the perfect combustion. The issue here is you also loose the effect of a lazy long yellow flame.

This is where the Heatmaster Enviro is different : the balance of tuning the fire to increase the efficiency, with out loosing the flame effect you want for a gas log fire is perfect.

As for heat output, the fan is no cheap barrel fan, but a snail design that increases the air flow per up to 3 time more than a traditional gas fire.

The TURBO mode really belts out the air flow, perfect for trying to heat a cold room : it will ensure you home is heated very fast.

When it comes to installation, the Enviro is so easy to install, it uses a power flue system.

What a Power Flue System is, its 2 x small 100mm & 75mm flexi pipes :

- One sucks air in from outside to power you fire
- The other one exhausts the gasses left over for your fire

Being powered by a fan, the first benefit is you can run these flue pipes 3mts horizontally. And you can run these vertical, horizontal and even under the floor...
